AI Connectivity Consent Notice

SPERT® Suite Web Applications

Version 2.3 · Effective Date: November 6, 2026

Operator: famousdavis, LLC (a Florida limited liability company)

This document records the text presented to users in the AI Connectivity consent dialog within SPERT® Suite web applications. It serves as the Operator's authoritative reference for the consent language users see and agree to before the Connect AI feature is activated.

SPERT® Suite applications implement Connect AI in two forms. Most allow an AI assistant both to write into the application and, optionally, to read existing content; at least one is read-only by design. The consent dialog differs accordingly. Section 2 records the dialog used by applications offering both modes, Section 3 records the dialog used by read-only applications, and Section 4 identifies which form each application uses.

Change of Operator. Effective September 12, 2026, the SPERT® Suite business was transferred from the sole proprietorship of William W. Davis, MSPM, PMP to famousdavis, LLC, a Florida limited liability company, which is now the Operator of the SPERT® Suite applications. This is a change of legal entity only. The transfer did not change the consent dialog text recorded in this Notice or AI Connectivity data handling, and the consent schema version is therefore unchanged — consent dialogs are not re-displayed on account of the transfer (see Section 5). References to the "Operator" in prior versions of this Notice are to be read as references to famousdavis, LLC as of that date.

1. Purpose and Scope

This Notice is a record, not a control. The consent dialog itself is the point of disclosure: it is presented before any AI session is created, it states what the AI assistant is permitted to do, and it must be accepted before the feature is activated. This Notice exists so that the Operator, and any organization evaluating SPERT® Suite for policy compliance, can review that language outside the application.

Accordingly, this Notice is published for reference but is **deliberately not linked from within the applications.** A user who wishes to review what they agreed to can re-open the consent dialog itself, as described in Section 5.

2. Consent Dialog — Applications Offering Write and Read Modes

This is the form of the dialog used by SPERT® Story Map and SPERT® Scheduler.

2.1 Title and Introduction

The following appears as the heading and introduction of the dialog:

> **Connect an AI assistant**
>
> Connecting lets your AI chatbot [build or edit content in] this project. You stay in control: the AI asks what to build before doing anything, and you choose what it can access.

The bracketed phrase varies by application: SPERT® Story Map reads "build a story map in this project"; SPERT® Scheduler reads "build and edit" followed by the name of the open project.

2.2 Write Mode Consent Block

The following appears in the Write Mode section of the dialog, accompanied by a checkbox, Write Mode being required for AI Connectivity in these applications. In SPERT® Story Map the checkbox is pre-checked and cannot be unchecked. In SPERT® Scheduler it starts unchecked, and Connect is unavailable until the user checks it:

> **Write Mode** (required)
>
> [Application-specific description of what the AI can create and edit — see below.]

The description beneath the Write Mode label states, for each application:

Application	Write Mode description as presented
SPERT® Story Map	The AI can create themes, backbones, and rib items in this project.
SPERT® Scheduler	Let the AI create and edit this project's activities, estimates, milestones, section headers and notes, and, with Read Mode, update each activity's progress: its Status, Actual Start and Actual Finish.

2.3 Read Mode Consent Block

The following appears in the Read Mode section of the dialog, accompanied by an unchecked checkbox that the user may optionally check:

> ☐ **Read Mode** (optional)
>
> [Application-specific description of what the AI can read — see below.]

The description beneath the Read Mode label states, for each application:

Application	Read Mode description as presented
SPERT® Story Map	Let the AI read your current story map so it can suggest changes in context.
SPERT® Scheduler	Let the AI read this project's full schedule — every scenario (including locked ones), their activities, estimates, milestones, section headers, dependencies, and computed, recorded and planned dates, plus activity notes, descriptions, and checklist/deliverable items — so it can make context-aware edits. Required for dependency edits, reordering activities and updating progress.

2.4 Links and Action Buttons

The following controls appear at the foot of the dialog:

> **AI privacy notice** (link, opens in a new tab) **[Cancel]** **[Connect]**

3. Consent Dialog — Read-Only Applications

This is the form of the dialog used by SPERT® Forecaster, in which the AI assistant can read but cannot write. There is no Write Mode block, because no write capability exists to consent to.

3.1 Title and Introduction

The following appears as the heading and introduction of the dialog:

> **Connect an AI assistant**
>
> This lets an AI assistant — Claude, ChatGPT, Copilot, Gemini and others — read the project you have open so it can explain your forecast, and answer questions about what the numbers mean.
>
> **The connection is read-only. The AI cannot change anything in SPERT Forecaster.**

3.2 Read Mode Consent Block

The following appears accompanied by a checkbox, pre-checked, which the user may uncheck:

> ☑ **Read Mode**
>
> Upload a copy of the currently open project to SPERT's cloud so the assistant can read it. Without this, the assistant can still explain how forecasting works, but cannot see your data. You can turn Read Mode off at any time, which deletes the uploaded copy.

3.3 Supplementary Disclosures

The following statements appear beneath the Read Mode block:

> - Only the project you currently have open is uploaded.
> - The copy is deleted when you disconnect, turn Read Mode off, or sign out.
> - This happens whether your storage setting is Local or Cloud — Read Mode uploads regardless.
> - The pairing stops being readable seven days after your last activity, and is deleted shortly after.
>
> In the last statement, "last activity" means the session's last activity, which includes requests from the AI assistant (see the AI Privacy Notice).

3.4 Links and Action Buttons

The following controls appear at the foot of the dialog:

> **AI privacy notice** (link, opens in a new tab) **[Cancel]** **[Connect]**

4. Form of Dialog Used by Each Application

As of the effective date of this Notice:

Application	Form of consent dialog
SPERT® Story Map	Write and Read (Section 2)
SPERT® Scheduler	Write and Read (Section 2)
SPERT® Forecaster	Read-only (Section 3)

Applications may be added, and an application's form may change if its capabilities change. This table will be updated accordingly.

5. Consent Storage and Re-Presentation Rules

The following rules govern how and when the consent dialog is presented:

- **Consent is recorded separately in each application.** The dialog is displayed the first time a user clicks "Connect AI" in a given application, in a given browser. Consenting in one SPERT® Suite application does not carry over to another; the user is asked again in each application.
- Upon connecting, the user's consent choices are recorded in that browser's local storage under an application-specific key, together with a consent schema version identifier and a datestamp. Applications offering both modes record Write Mode as granted and Read Mode as granted or declined. Read-only applications record only the Read Mode choice, there being no write permission to record.
- On subsequent use in the same browser, where a consent record of the current schema version exists **and** a previous session reference is still present, the dialog is not re-displayed and the recorded choices are applied automatically.
- If the consent schema version changes — indicating a material update to what the AI assistant is permitted to do or to AI Connectivity data handling — the dialog is re-displayed regardless of prior consent.
- **Read Mode may be changed at any time** from the Connect AI panel within the application, using the Read Mode control shown there. Changing it in the panel takes effect immediately and does not re-display the consent dialog.
- **Disconnecting is the supported way to review the consent text again.** Disconnecting ends the active AI session and removes session data from the cloud relay, subject to Section 6 of the AI Privacy Notice if the relay server cannot be reached. The local consent record and the session reference are both cleared, so the consent dialog is displayed again the next time the user clicks "Connect AI."
- Consent is browser-local and device-local. It is not synced to a SPERT® cloud account. A user accessing SPERT® in a different browser or on a different device is presented with the dialog on first use of Connect AI there.

6. Relationship to the AI Privacy Notice

This Notice records consent language only. What happens to your data once you have consented — where it is transmitted, how long it is held, and what your AI provider may do with it — is described in the AI Privacy Notice, published at https://spertsuite.com/ai-privacy and linked from the consent dialog itself.
